

std::true\_type

gxx::true\_type

is\_function< Ret(Args...) volatile >

```
graph BT; A["is_function< Ret(Args...) volatile >"] --> B["std::true_type"]; A --> C["gxx::true_type"];
```

The diagram illustrates a C++ trait specialization. At the bottom, a gray box contains the trait definition `is_function< Ret(Args...) volatile >`. Two blue arrows point upwards from this box to two white boxes at the top. The left white box contains `std::true_type` and the right white box contains `gxx::true_type`. This indicates that the `is_function` trait is specialized for both `std::true_type` and `gxx::true_type`.
